**Amendments to the Claims:**

A listing of the entire set of pending claims (including amendments to the claims, if any) is submitted herewith per 37 CFR 1.121. This listing of claims will replace all prior versions, and listings, of claims in the application.

**Listing of Claims:**

1. (Previously presented) A system for providing personalized services, comprising  
an apparatus which is capable of personalizing its behavior in accordance with a user profile, and  
a gatekeeper device that is configured to selectively transmit a user identification only, in response to receipt of a communication from the apparatus,  
wherein  
the apparatus is configured to effect the personalizing of its behavior based on the user identification
2. (Previously presented) A system as claimed in Claim 1, characterized in that  
the gatekeeper device includes a user control to selectively transmit the user identification.
3. (Cancelled)
4. (Previously presented) A system as claimed in Claim 1, characterized in that  
the gatekeeper device is configured to provide notification of the communication from the apparatus.
5. (Previously presented) A system as claimed in claim 4, characterized in that  
the communication from the apparatus includes an identification signal of the apparatus that distinguishes the apparatus from an other apparatus.

6. (Previously presented) A system as claimed in claim 1, characterized in that  
the gatekeeper device is further configured to enable selection of one or more options  
that affect selectively transmitting the user identification at subsequent occasions.
7. (Previously presented) A system as claimed in Claim 1, characterized in that  
the apparatus is further configured to:  
generate an identity tag which identifies a select personalization, and  
communicate the identity tag to the gatekeeper device, the gatekeeper device  
being capable of storing said identity tag for use as the user identification at subsequent  
occasions.
8. (Previously presented) A system for providing personalized services, comprising  
an apparatus which is capable of personalizing its behavior in accordance with a user  
profile, and  
a gatekeeper device that is configured to selectively transmit a user identification, in  
response to receipt of a communication from the apparatus,  
wherein  
the apparatus is configured to effect the personalizing of its behavior based on the user  
identification and a user profile, and  
the gatekeeper device is capable of storing the user profile for selective  
communication to the apparatus.
9. (Previously presented) A system as claimed in Claim 8, characterized in that the apparatus  
is capable of exchanging the user profile with the gatekeeper device or another apparatus.

10. (Previously presented) A gatekeeper device comprising:  
a transceiver that is configured to:  
receive communication from an apparatus that is configured to effect a personalization of the operation of the apparatus based on a user identification, and  
selectively transmit the user identification only; and  
one or more user controls that facilitate selectively transmitting the user identification.
- 11-12. (Cancelled)
13. (Previously presented) A system as claimed in Claim 1, characterized in that  
the apparatus is further configured to effect the personalizing of its behavior based on user behavior following a prior receipt of the user identification.
14. (Previously presented) A method of facilitating personalization of a plurality of apparatuses, comprising  
receiving a communication from each apparatus of the plurality of apparatuses, and  
selectively communicating a user identification to each apparatus, in response to the communication from each apparatus, to selectively effect a personalization of each apparatus of the plurality of apparatuses based on the user identification.
15. (Previously presented) The method of claim 14, wherein  
selectively communicating includes receiving a user selection that effects a transmission of the user identification.
16. (Previously presented) The method of claim 15, wherein  
the user selection also controls future transmission of the user identification to each apparatus.

17. (Previously presented) The method of claim 14, wherein  
the personalization of each apparatus is further based on user behavior following a  
prior communication of the user identification,

18. (Previously presented) A system as claimed in Claim 8, characterized in that the  
gatekeeper device is capable of exchanging the user profile with a plurality of other  
apparatuses.

19. (New) A gatekeeper device comprising:  
one or more user operable controls, and  
a transceiver that is configured to:  
receive a communication from an apparatus, including an identification of the  
apparatus,  
determine a state of the gatekeeper device relative to the apparatus, from a  
plurality of states, based on the identification of the apparatus, and  
selectively transmit an identifier of a user, based on the state of the gatekeeper  
device relative to the apparatus;  
wherein  
the state of the gatekeeper device relative to the apparatus is selectively controlled by  
the one or more user operable controls.

20. (New) The gatekeeper device of claim 19, wherein  
the plurality of states includes:  
a first state, wherein the transceiver transmits the identifier of the user only  
upon an explicit authorization by the user, and  
a second state, wherein the transceiver transmits the identifier of the user  
without user intervention.

21. (New) The gatekeeper device of claim 20, wherein  
the plurality of states further includes:  
a third state, wherein the transceiver does not transmit the identifier of the user.
22. (New) The gatekeeper device of claim 19, further including  
one or more indicators that are configured to indicate the state of the gatekeeper  
device relative to the apparatus.
23. (New) A method of controlling transmission of a user identifier from a portable device  
including:  
receiving, at the portable device, an identification of an apparatus,  
determining a state of the portable device relative to the apparatus from a plurality of  
states, based on the identification, and  
selectively transmitting the user identifier based on the state of the portable device  
relative to the apparatus.
24. (New) The method of claim 23, further including:  
receiving a user input at the portable device, and  
controlling the state of the portable device relative to the apparatus based on the user  
input.
25. (New) The method of claim 24, wherein  
the plurality of states includes:  
a first state, wherein selectively transmitting the user identification includes  
waiting for an explicit user input to enable the transmitting; and  
a second state, wherein selectively transmitting the user identification includes  
transmitting the user identification without an explicit user input.

**26. (New) The method of claim 25, wherein**

**the plurality of states also includes:**

**a third state, wherein selectively transmitting the user identification includes preventing the transmitting.**

**27. (New) The method of claim 23, further including:**

**providing an indication of the state of the portable device relative to the apparatus.**
